Comprehensive invention relates to the isolation of novel mean persent invention relates to the isolation to novel mean polymeticle exception relates to an enable to any objectides exhibit activities relating to angiogenesis, cytokine, cell polymeticles exhibit activities relating to angiogenesis, cytokine, cell principal activities. The polypeptides are involved in the proliferation, differentiation and survival of pluripotent and totipotent of proliferation, differentiation, maniferature of bio-phasmaceuticals and the calls, and are useful for re-engineering damaged or diseased tissues, transplantation, maniferature of bio-phasmaceuticals and evelopment of bio-sensors. The polypeptides can be used to manipulate stem calls in culture to give rise to neuroepithalal cells that can be used to augment or replace calls damaged by illness, autoimmune disease, accidental damage or genetic disorders. The polypeptides and brain tissue and are useful for the treatment of central and peripheral nervous system and are useful for the treatment of central and peripheral nervous system of proliferation of neuropathies, such as Altahamer's, Parkinson's disease, anyonived in chemotractic or chemokines system of proliferation of haematopoiesis and are useful for treatment of central and peripheral and peripheral conformation of haematopoiesis and are useful for treatment of the central and peripheral and disease. The polypeptides are also useful for gut protection of regeneration and treatment of lung or liver fibrosis, reperitation and erreatment of lung or liver fibrosis, repetitation of periodontal disease. The polypeptides are also useful for growth, in various tissues, various immune deficiencies and disorders infections, such as asthma or other respiratory problems. The polypeptides are involved in thrombolysis or thrombolysis and are useful in thrombolysis or thrombolysis and are useful for any activity, and are useful for treating activity and are useful for treating activity and are useful for treating activity and are

Mutant genes isolated from tumors showing microsatellite instability, useful for diagnosis, treatment and prevention of tumors, also related peptides and antibodies.

Claim 3; Fig 2; 31pp; German.

This invention describes novel genes isolated from MSI+ (microsatellite instability) tumour cells, containing coding mononucleotide or dinucleotide microsatellites (cMNR and cDNR), differing by mutations in centra or corresponding genes of non-MSI+ (tumour) cells, and encoding 'neopeptide'-containing gene products. The products of the invention have cytostatic activity, are capable of inducing a specific immune response (humoral and cellular) and are useful for gene therapy. The products of the invention are used for the molecular investigation and diagnosis of MSI+ tumors (or their precursors) and are useful for prophylactic or therapeutic immunisation against MSI+ tumors. This sequence represents the human KIAA0040 neo cMNR region described in the disclosure of the invention

The colon cancer antigens have cytostatic activity and can be used in gene therapy and variety and can be used in gene therapy and treatment of diseases associated with inappropriate P expression. For example, N and P may be used in the prevention, diagnosis example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorcatal

The polynucleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polypeptides have various cytokine-like activities, e.g. stem cell growth factor activity, nematopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activity inhibin activity and may be useful in the diagnosis and/or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.

The present invention relates to the isolation of novel human polynoleocide sequences and their encoding polyspeptides. The novel polynoleocide sequences and their encoding polyspeptides. The novel polynoleocide sequences and their encoding polyspeptides. The novel polypeptides are involved in the prolypeptides are involved in the growth factor activities. The polypeptides are involved in the prolypeptides and are useful for the engineering damaged or diseased tisseased transplantation, ammifacture of bio-pharmaceuticals and development of bio-sensors. The polypeptides are used to manipulate stem cells in culture to give rise to neuroepithelal cells that can be used to augment or replace cells damaged by illness, autoimmune disease, accidental damage or genetic disorders. The polypeptides induce the can be used to augment or restment of central and peripheral nervous system diseases and neuropathelas, such as Alzheimer's. Parkinson's disease, and neuropathelas, such as Alzheimer's. Parkinson's disease, and neuropathelas and requencation of harmatopoids and are useful for treating myeloid or lupphoid cell disorders. In chemication of harmatopoids and are useful for treating myeloid or regeneration of bone, cartilage, tendon, ligament and/or nerve tissue for regeneration of bone, cartilage, tendon, ligament and/or nerve tissue growth, in tissue repair. The polypeptides are also useful for gut protection or respencation and treatment of lung or liver fibrosis, reperfusion induving severe combined immunodeficiency (SCID), bacterial or fungal including severe combined immunodeficiency (SCID), bacterial or fungal including severe combined immunodeficiency (SCID), allergic reactions and continued arthritis, disbetes mellitus, myasthenia gravis), allergic reactions and continued sorders (including hereditary disorders and involved in thrombolysis or thrombosis and are useful in the cameer. They also inhibit the growth, infection or function of infections cancer. They also inhibit the growth, infection are involved ande
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            encoded by novel contigs assembled in the examples of the present
invention. Note: The sequence data for this patent did not form part of

WPI; 2003-058431/05. N-PSDB; ABX34828 New purified disease detection and treatment molecule proteins and polynucleotides, useful for diagnosing, treating or preventing cancers (e.g. leukemia or sarcoma), anemia, Crohn's disease, AIDS, osteoporosis or hepatitis.

Claim 27; SEQ ID NO 785; 339pp + Sequence Listing; English.

This invention describes a novel disease detection and treatment molecule polypeptide (MDDT) which has anti-inflammatory, immunosuppressive, osteopathic, cytostatic, anti-iHIV, haemostatic, nephrotropic, ortostatic, anti-HIV, haemostatic, nephrotropic, antipsoriatic and hepatotropic activity. The polymucleotides and the polypeptides of the invention can be used for gene therapy, protein replacement therapy and are useful for treating a variety of diseases or conditions. These polypeptides or polymucleotides are particularly useful for diagnosing, treating or preventing cell proliferative disorders (e.g. cancers including adenocarcinoma, releasemia, lymphoma, melanoma, myeloma or sarcoma, anaemia, Crohn's leukaemia, lymphoma, melanoma, myeloma or sarcoma, namemia, Crohn's syndromes, inflammation, osteoporosis, thrombocytopaenia, psoriasis or hepatitis, ABU11450-ABU11845, described in the disclosure of the invention. NOTE: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format from WIPO at Etp.wipo.int/pub/published_pct_sequences

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to isolated insulin-like growth factor binding protein-like (IGFBP-like) polypeptides and their associated polymuclectides. The DNA sequences can be detected by contacting a sample with nucleic acid primers that anneal to the DNA and amplifying a product comprising a portion of the sequence. Detection of the product indicates the presence of DNA. The protein sequences can be detected by contacting a sample with a compound that binds to the polypeptide to form a complex. Detection of the complex indicates the presence of the protein. The sequences of the invention are useful for treating a subject having a need to inhibit activity or expression of IGFBP-like sequences. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      involves administering an antagonist of the polypeptide, a polymerotide that inhibits the expression of the mucleotide sequence or a therapeutic amount of the polypeptide that competes for its ligand and a carrier. The sequences are useful in treatment of disorders such as cancer, or to

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). (II) polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I is useful in gene therapy techniques to restore normal cativity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                        Human, chromosome mapping, gene mapping, gene therapy, forensic; food supplement, medical imaging, diagnostic, genetic disorder.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     390

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel human cadherin 63 polypeptide and its encoding polynucleotide. The invention also discloses a method for production of the polypeptide. The product of the invention can be used for the treatment of various diseases, such as malignant tumours, haemolysis, HIV infection, immunological diseases and inflammations. Thi sequence represents the human cadherin 63 described in the method of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          .::|||||||||||::||||||:::|||

sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed sectivity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food sites expressing (II). (II) and its binding partners are useful in medical imaging of sites expressing (II). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ---LeuGinileGinAlaArgLys 182
                                                                                                                                                                                                                                                                                     The invention relates to isolated polynucleotide (I) and polypeptide (II)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   involving aberrant protein expression or biological activity. The bolypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention. Note: The sequence data for this
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   154 SerProGlyAsnLysLysGlyGlyLeuGlyLysArgGlySerSerLysAlaLeuTrpLeu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CCATITITGCTGCTGTGTGTGGAGGTGCTGTCAGTGGCATGCCCAAACCCAAAGCTGGAAG

The invention relates to an isolated polymuclectide (ACF64435-ACF64733)

canoding a Propionibacterium acnes protein. The invention also relates to polypeptides encoded by the polymuclectides (ABM35624-ABM64536) and to immunogenic fragments of P. acnes polypeptides. The invention additionally encompasses expression vectors and host cells comprising a polymuclectide of the invention; and invention; fusion proteins comprising a polypeptide of the invention; a method for stimulating an immune response specific for a P. acnes polypeptide and an isolated T cell population comprising T cells prepared polymetries and insolated T cell population comprising P. acnes polypeptides, polymuclectides, antibodies, fusion proteins, T cell populations, or antigen-presenting cells that express the polypeptide); a method and kit can detecting or determining the presence or absence of P. acnes in a patient. The P. acnes polypeptides, polymuclectides, antibodies, fusion patient, and a method for inhibiting the development of P. acnes in a patient. The P. acnes polypeptides, polymuclectides, antibodies, fusion proteins, T cell populations or antigen-presenting cells that express the polymeptides are useful for diagnosing, preventing or treating acnes to relating an immune response against P. acnes or primers for moteic acid hybridistation; and mamune response against P. acnes, or for treating acnes to sequence represents a specifically claimed P. acnes, or for treating and the kit is useful for performing a diagnostic assay. The present compassion of an immunogenic region. Note: The sequence date for this patent did not form part of the printed specification, but was the present sequence in electronic format directly from WIPO at New Propionibacterium acmes polypeptides and polynucleotides encoding the polypeptide, useful for diagnosing, preventing or treating acme vulgaris, or for stimulating an immune response specific for a P. acmes protein. ```
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PGR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynuclectides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful for treating disorders of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynuclectide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity amino acid sequences of data and products dependent on DNA and amino acid sequences of the invention. Note: The sequence data for this parent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at the printed specification, but was obtained in electronic format directly from WIPO at

New protein kinase genes and polypeptides, useful for diagnosing diseases associated with a protein kinase, or in gene therapy for treating e.g. Parkinson's disease, migraine, myocardial infarction, allograft rejection or cancers.

Claim 9; Page 71-72; 258pp; English.

AB277126 to AB277165 encode the human protein kinases given in ABP96048 to ABP96087. The protein kinases have antiasthmatic, antiinflammatory, antidabetic, antiparkinsonian, antimigrathe, cardiant, cytostatic, immunosuppressive and vulnerary activities, and can be used in gene therapy. A protein kinase therapeutic agent from the present invention, particularly a protein kinase gene agonist or antagonist, can be used for treating a disease or condition associated with a protein kinase in an individual. These diseases include chronic obstructive pulmonary diseases (COPD), asthma, non-insulin dependent diabetes, Parkinson's diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human polypeptides, termed NOVX, and the polymucleotides encoding them. The polypeptides and polymucleotides are useful for diagnosing disease, and screening for potential therapeutic agents. The sequences are useful for treating metabolic disorders, cardiomyopathy, diabetes, hypertension, congenital heart defects, aortic stenosis, atrial septal defect (ASD), atrioventricular canal defect, ductus arteriosus, pulmonary stenosis, subacrtic stenosis, ventricular septal defect (VSD), valve diseases, tuberous sclerosis, scleroderma, atherosclerosis, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzheimer's disease, Parkinson's disease, immune disorders, haematopoietic disorders, haemophilia, hypercoagulation, Crohn's disease
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gerlach V;
n SJ, Ji W;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New isolated NOVX polypeptide useful for treating atherosclerosis, metabolic disorders, diabetes, obesity, infectious disease, anorexia, neurodegenerative disorders, Alzheimer's disease and cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Guo X, Kekuda R, Miller CE, Malyankar UM, Spytek KA;
